Having Trouble With Your A/C?

Your window A/C unit may freeze up if used during extreme outside temperatures.
If you are having trouble:
- Thaw the unit by turning it off & waiting 2-3 hours
- A/C unit is not meant to be used when outdoor temperatures are below 50 °. This could result in burning up the unit.

It’s simple to regulate the heat in your room

Your room’s heater works like this:

Make sure nothing (desk, books, bed, carpet, etc.) is blocking your heater.

Try one towel first to see if the room temperature gets cool enough

Restrict the air-flow with a rolled towel

Use trial & error until you reach the right combination

Add towels if the temperature still isn’t cool enough

You can regulate the temperature in your residence hall room by trying the following things:

- Make sure the heater unit is not blocked by furniture if you are cold
- See if the damper works on heater unit & adjust (some dampers can be opened/closed) On South Green the dial moves counter-clockwise.
- If damper is inoperable & you’re still too warm, roll up a towel & place it on the floor under the heater
- Add & subtract towels to restrict or allow air flow
- Or, draw in cool outside air by running the fan/vent on the window A/C unit
